Sum Peter h

Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were randomly assigned to a control group (CG) and an exercise group (EG). The EG performed a 10-week training program consisting of three sessions per week. The CG did not exercise. The HR and EE were measured at rest and during a 30-min submaximal exercise test at baseline and after 10 weeks. The EG showed a significant decrease in HR and an increase in EE compared to the CG. The results suggest that a 10-week training program can improve the cardiovascular and metabolic health of sedentary, middle-aged women.
